

Maintenance Monitor

QUICKLY ACCESS YOUR NETWORK DATA

Collects and Stores:

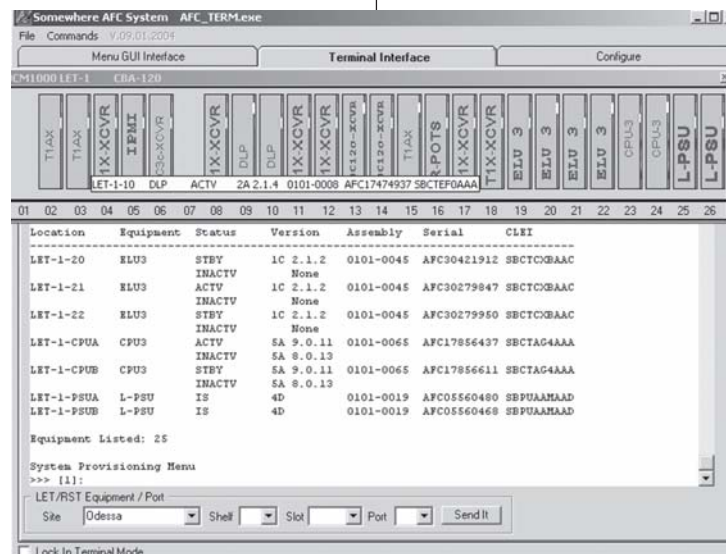

- Switch and network faults
- Call traces
- All maintenance printouts
- Data from any device on your network

Maintains:

- A history log
- Retrieval of specific data by date
- Access to switch or other network elements
- AFC interface program

Designed specifically for the independent telephone industry, NSG's **Maintenance Monitor** is: 1) A major time saver; and 2) A

simple report generator that anyone with minimal training can use.

AFC Interface

The **AFC Interface** program allows easy logon access to your AFC equipment. The above screen shot shows detail of the selected card. Macro buttons are available to automate administrative functions.

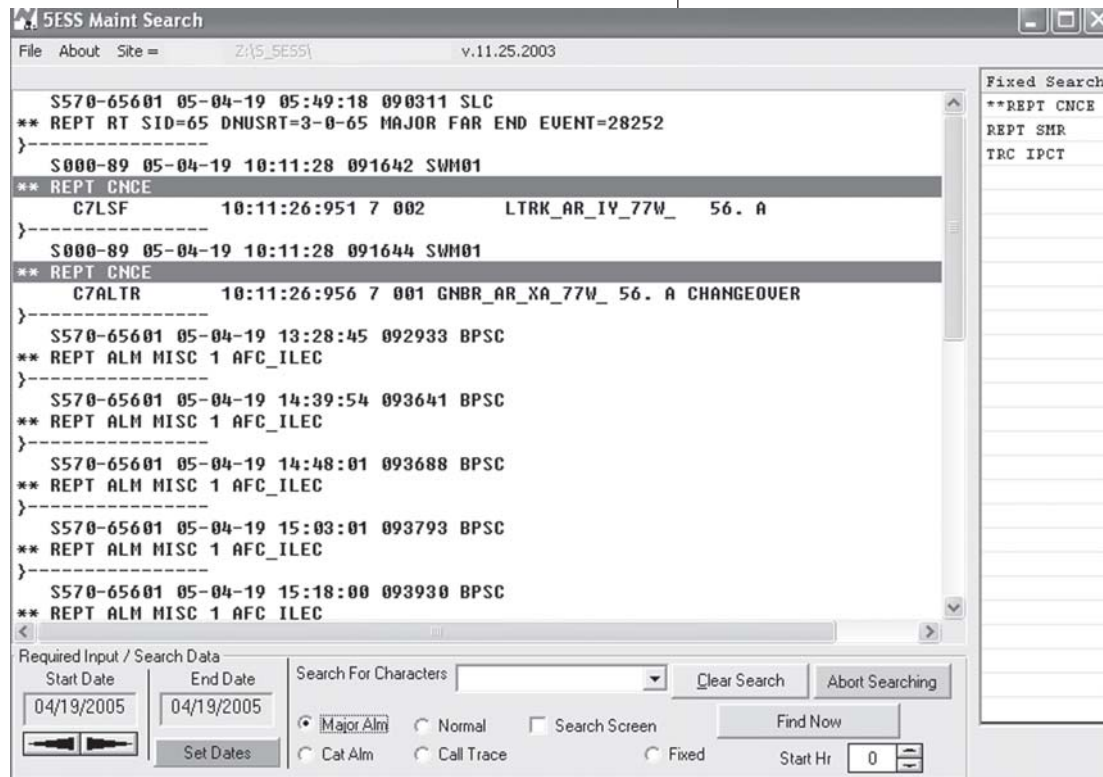

The **Search Maintenance** program enables you to retrieve malicious call trace reports directly from the Collector PC without wad-

ing through mountains of paper printouts. This module logs all maintenance reports (ROP) and makes them accessible to all authorized staff. Switch alarm data is easily retrieved for the current day or past days. Operations are enhanced, diagnostic efficiency is improved, and network performance is maintained.

CONTINUED >

The **View Maintenance** program allows the customer to view maintenance data in real time from the switch or other network ele-

ment. This can run on a user's desktop and monitor the real time activity of the switch (through network access).

**SESS
Maintenance
Search**

The above screen displays a typical Maintenance Search report. The 'Search for Characters' field allows the user to type any characters in the search field to locate. The 'Fixed Search' grid on the right side of the screen shows preset searches the user can enter for quick searches. Simply double-click on the grid item and the program will search for those characters. You can easily find switch alarms by selecting the option buttons at the bottom of the screen.

Key NSG software advantages include:

- Ease of use
- Familiar navigation tools
- Minimal training required
